

## 2019 Arkansas Soybean Performance Results, Disease Rating, and Agronomic Characteristics

Dr. Jeremy Ross  
Extension Agronomist -  
Soybeans

John Carlin, Program  
Director, Variety Testing

Joshua A. Still, Program  
Technician, Variety  
Testing

Richard Bond  
Program Associate,  
Variety Testing

Dr. Jason Norsworthy,  
Professor

Dr. Travis Faske  
Extension Plant  
Pathologist

Michael Emerson  
Plant Pathology  
Program Associate

Dr. Trent Roberts,  
Associate Professor

Hundreds of soybean varieties are commercially available to growers in Arkansas. Varietal performance, including yield, varies according to location, environmental adaptability to soils, maturity, lodging, height, disease and nematode resistance, and herbicide and chloride sensitivity. This information listed in this publication is largely derived from the University of Arkansas System Division of Agriculture Soybean Performance Trials and screening programs, and is provided as an aid in variety selection.

Since proper variety selection involves knowledge of yield potential, maturity, disease reaction, herbicide sensitivity, etc., these and many other important characteristics are listed in **Tables 8 and 9**. Varieties are considered adapted to Arkansas conditions based primarily on their yield performance across the different geographical regions of Arkansas. The location, soil description, and cultural information for each of the 2019 Arkansas Soybean Performance Tests are found in **Tables 1**.

**All varieties listed in this publication have been tested in the University of Arkansas System, Division of Agriculture Soybean Performance Trials.**

Soybean variety performance may vary from year to year, and two-year averages are better predictors of performance than data from a single year. Superior performance across several locations suggests that a variety has wide adaptability, thus multi-year and multi-location yields are particularly useful for making variety selection decisions.

### ADAPTED SOYBEAN VARIETIES FOR EARLY SOYBEAN PRODUCTION

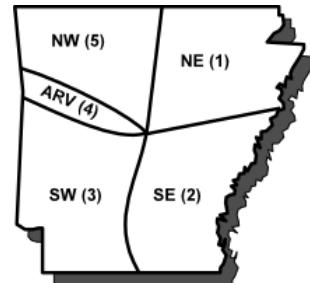

Generally, varieties within MG IV are the best adapted for these early (April) plantings in Arkansas; however, there are situations where varieties from MG III and V may perform well. Recent research indicates that indeterminate MG IV varieties can produce acceptable yield when planted early (April) and will normally mature in August through mid-September. Varieties of differing relative maturity (even within the same MG) are recommended in an attempt to spread out the risk of shattering due to adverse weather conditions or mechanical problems at harvest. In Arkansas, the following designations apply to varieties representing the Recent research indicates that indeterminate MG IV varieties can produce acceptable yield when planted early (April) and will normally mature in August through mid-September.

Varieties of differing relative maturity (even within the same MG) are recommended in an attempt to spread out the risk of shattering due to adverse weather conditions or mechanical problems at harvest. In Arkansas, the following designations apply to varieties representing the various MG's: III – very early maturity; IV – early maturity; and V – mid-season maturity.

## ABOUT THIS PUBLICATION

**Tables 1** consist of cultural information that pertains to the 2019 University of Arkansas System Division of Agriculture Soybean Performance Trials (<http://arkansas-variety-testing.uark.edu>). **Tables 2 through 7** contain varietal yield information for 2016, 2017, 2018, and 2019. **Tables 8 and 9** contain the many varietal characteristics of those varieties designated as being adapted to the Arkansas soybean production environment.

**Users of this publication are encouraged to review the “Key Code” page for further explanation regarding varietal rating to disease, herbicide sensitivity and other agronomic considerations.**

**Figure 1. Area of Adaptation for Soybean Maturity Groups for All Production Systems**

**Northeast Arkansas (1):** Groups III, IV, or V

**Southeast Arkansas (2):** Groups III, IV, or V

**Southwest Arkansas (3):** Groups III, IV, or V

**Arkansas River Valley (4):** Groups III, IV, or V

**Northwest Arkansas (5):** Groups IV or V

Acknowledgements are extended to the host of University of Arkansas System Division of Agriculture workers for their significant contributions to this update.

**The KEY CODE for all the following tables is found on the back page. Refer to the KEY CODE for a description of the abbreviated varietal characteristics.**

**HOW TO MAKE YIELD COMPARISONS USING THE FOLLOWING TABLES:** The LSD (0.05), Least Significant Difference, represents the minimum yield difference required between two varieties within the same location before concluding that their yields are truly different (while assuming a 5% risk that the yield differences are due to random chance.) Use only the LSD value listed below each column (location-maturity group) to compare variety yield averages among varieties within that column.

**Note: “Shading” of a variety mean indicates that there are no statistical difference between that varietal mean and the highest yielding varietal mean at the test location utilizing the appropriate LSD (0.05) value.**

# 2019 Soybean Update

## Key Codes for All Tables

“ • ” Information Not Available

<sup>1</sup>Keiser Irrig = Northeast Research and Extension Center, Keiser, AR Irrigated Test

Keiser LP Irrig = Northeast Research and Extension Center, Keiser, AR Late-Planted Irrigated Test

Marianna Irrig = Lon Mann Cotton Research Station, Marianna, AR Irrigated Test

Pine Tree Irrig = Pine Tree Research Station, Colt, AR Irrigated Test

Rohwer Irrig = Rohwer Research Station, Rohwer AR Irrigated Test

Rohwer LP Irrig = Rohwer Research Station, Rohwer AR Late-Planted Irrigated Test

Stuttgart Irrig = Rice Research and Extension Center, Stuttgart, AR Irrigated Test

Stuttgart Non-irrig = Rice Research and Extension Center, Stuttgart, AR Non-irrigated Test

<sup>2</sup>At Keiser and Marianna non-Xtend soybean varieties showed symptoms consistent with injury attributed to off-target movement of dicamba.

<sup>3</sup>Average Yield from 2018 and 2019.

<sup>4</sup>Average Yield from 2016, 2018, and 2019.

<sup>5</sup>Average Yield from 2017, 2018, and 2019.

<sup>6</sup>Average Yield from 2017 and 2019.

<sup>7</sup>Average Yield from 2016, 2017 and 2019.

<sup>8</sup>Rowher Late Planted Xtend cultivar test was discarded due to poor uniformity caused by standing water.

<sup>9</sup>By using the greatest level of disease reported over the years tested, a standardized designation system for all disease and nematode screenings is as follows: **HR = Highly Resistant, R = Resistant, MR = Moderately Resistant, MS = Moderately Susceptible, S = Susceptible, VS = Very Susceptible**

<sup>10</sup>Evaluation of soybean cultivars for reaction to root-knot nematode was conducted in a greenhouse and field test. Nematode population density ranged from moderate to severe in the field and eggs of *M. incognita* were used as inoculum in the greenhouse test. Greenhouse tests were conducted at the Southeast Research and Extension Center, Hope, AR and the field trials were conducted in a soybean production field, Kerr, AR. Greenhouse root gall ratings were a visual assessment of the entire root system using a 0-10 scale (<1.0 = R; 1.0-2.0 = MR; 3.0-5.0 = MS; 6.0-50.0 = S; >50.0 = VS). Field root gall ratings were a visual assessment of the percentage root system galled using on a 0-100 scale (0-1.0 = HR, 1.1-4.0 = R, 4.1-9.0 = MR, 9.1-20.0 = MS, 20.1-40.0 = S, 40.1-100 = VS) at R5 to R5+ growth stage.

<sup>11</sup>Stem Canker Reaction-10 plants per plot were inoculated with infested toothpicks, replicated 3 times.

<sup>12</sup>Chloride Sensitivity – Excluder varieties accumulate chloride and restrict it to the roots. Includer varieties accumulate chloride throughout the plants. Varieties with a Mixed population have both Includer and Excluder plants. Don't assume that high soluble salts constitute a chloride ion problem. Chloride levels should be determined by irrigation water tests and/or plant tissue analysis.

<sup>13</sup>Soybean growth habit; Ind = Indeterminate; Det = Determinate; Std = Semi-determinate.

<sup>14</sup>Days to Maturity represent the average number of days (Keiser Irrigated, Pine Tree Irrigated, and Rohwer Irrigated Tests) from planting until 80% of the soybeans in the plot were thought to be mature.

<sup>15</sup>Days to Maturity LP represent the average number of days (Keiser Irrigated Late-Planted and Rohwer Irrigated Late-Planted Tests) from planting until 80% of the soybeans in the plot were thought to be mature.

<sup>16</sup>Soybean lodging is an average of data from the Keiser Irrigated, Pine Tree Irrigated, and Rohwer Irrigated Tests and is reported using the following criteria: 1 = all plants erect, 2 = all plants slightly leaning or a few plants down, 3 = all plants moderately leaning or 25-50% of the plants are down, 4 = all plants considerably leaning or 50-80% of the plants are down, 5 = all plants down.

<sup>17</sup>Soybean plant height reported in inches and is an average of data from the Keiser Irrigated, Pine Tree Irrigated, and Rohwer Irrigated Tests.
