Ten Easy Ways to Kill a Tree (And How to Avoid Them)

Kyle Cunningham Associate Professor of Forestry

DIVISION OF AGRICULTURE

RESEARCH & EXTENSION University of Arkansas System

Trees that grow in our communities provide us with many benefits, but they face many life-threatening challenges, both from the environment and from people. These trees must be properly cared for to ensure that they will continue to provide benefits.

Ten commonly seen tree care practices, applied incorrectly, can lead to tree stress and eventual death. These practices include selecting the wrong tree species for the site, improper planting procedures, improper mulching, incorrect staking, mechanical injury, topping and poor pruning, root damage, soil compaction, improper watering and improper fertilizer applications.

Homeowners and tree care professionals can follow several simple steps of proper tree care to help ensure long lives for trees in our communities. The following pages describe ten common mistakes made during the pre-planting, planting and post-planting care phases of a tree's life and the correct alternatives.

Your tree has much to offer – don't kill it!

Tree and Site Selection

How to kill a tree:

- Plant a tree that will
 outgrow a small space.
 Disregard overhead or underground obstructions.
- • • •

The correct tree care practice:

- Match the species to the site consider the tree's mature size and space needs.
- A tree's branches need space to grow up and out, and roots need space to grow out far from the trunk.

- Remove the container and as much of the burlap as possible (at least the upper half) without causing the rootball to fall apart.
- Backfill and lightly tamp the soil and water well. Add mulch but no fertilizer (see #3 and #10).

Mechanical Injury

How to kill a tree:

5. Use the tree as a bumper when lawn mowing or string trimming. Scrape off the bark and injure the live tissues underneath.

The correct tree care practice:

• Use mulch to control weeds, conserve water, moderate soil temperatures and keep mowers and trimmers away (see #3).

3) remove stub at branch collar.

- About 90 percent of a tree's roots are in the top 12-18 inches of the soil and extend out several times the height of the tree.
- Avoid cutting roots larger than 1 inch diameter inside the crown's dripline.
- Use fence barriers during construction. Place barriers 1 foot away from trunk for each inch of trunk diameter.

- Changing the grade by removing soil exposes the roots, and adding lots of soil smothers the roots.
- Adding as little as 3-4 inches of soil can kill a tree.
- Compaction decreases the pore spaces' ability to hold water and oxygen for the roots.

Urban and Community Tree Facts

- The average city tree removes 13 to 48 pounds of carbon dioxide per year from the air. (American Forestry Association)
- Urban trees are 15 times more efficient in removing carbon dioxide than are forest trees. (American Forestry Association, Global ReLeaf)
- It costs 10 cents per pound to remove carbon dioxide by improving auto emissions and 1 cent per pound to remove it by planting trees. (American Forestry Association, Global ReLeaf)
- Tree canopies reduce soil erosion by diminishing the impact of raindrops on barren surfaces.

- A typical tree produces about 260 pounds of oxygen each year. Two trees can supply a person's oxygen needs. (USDA Forest Service)
- An average tree absorbs 10 pounds of pollutants from the air each year, including 4 pounds of ozone and 3 pounds of particulates. (USDA Forest Service)
- One large sugar maple can remove the airborne lead emitted by cars burning 1,000 gallons of gasoline.
- A large leafy tree may pump up to a ton of water from the soil every day through transpiration.
- On a hot day, a tree may transpire 900 gallons of water into the air, cooling as much air as six room-size air conditioners.
- Unlike some other investments that depreciate, a tree's value increases with each passing year. Trees increase home property values 7 to 21 percent, depending on the number and size of the trees. (City of Portland)
- Each urban tree with a 50-year lifespan provides an estimated \$273 a year in reduced costs for air conditioning, erosion control, stormwater control, air pollution and wildlife shelter. (City of Portland)
- Urban trees can reduce city stormwater runoff by as much as 31 percent.
- Patients with a view of trees and plants had shorter hospital stays and used fewer pain killers. (Texas A&M University)
- Ginkgo trees provided food for dinosaurs, and yet they can still be found along city streets today.
